

The Piaggio P-180 V3.0 has been updated! The optional upgrade package includes:

- Misbehaving clickspots: altitude selector now is only +/-100ft, easily operable via mouse wheel.
- Missing Recognition light effect: the file was mistakenly not included in the 3.0 release
- lowered ITTs: for better hot climate behavior; now only very (very) hot days cause problems.
- passenger removed from cabin
- Heading indicator/gyro now automatically synchronizes periodically.
- loading time reduced: CAB gauge is now packed properly

And, for FS-X users only:

- Autopilot ALT Mode misbehavior: this function now performs as intended (the problem was not present in FS-9).
- High-resolution cabin and cockpit textures.

Below you can download the update. Be sure to select the matching FS version, updating with the wrong sim version will cause the package to stop working!
